## PROBABILITY FORECAST VERIFICATION AIDS

1. Introduction. 2WW/DNS has developed worksheets and HP-97 programmable calculator software to facilitate probability forecasting data gathering and analysis, and to assist 2WW field units in probability forecasting tasks. Instructions follow for completion of the worksheets and for use of the HP-97 software. Further background on this subject is contained in AWSP 105-51 and 2WW TN 79-1. (2WW TNs 78-1, 78-4, 78-6 and 79-6 also provide background on probability forecasting). Both the Form 26 and 28 are intended primarily as individual forecaster worksheets. The intent is for forecasters to maintain data on their own forecasts and to analyze the reliability and sharpness on a periodic basis (normally, but not necessarily, monthly). This procedure provides forecaster feedback which is the primary purpose for this type of forecast verification. The computation of the Brier Score and associated statistics as a general rule should only be accomplished for overall unit data. It can be done for individuals, but this is not recommended. As a general rule the tracking of skill scores from month to month is to be minimized in favor of time spent on analysis and correction of the bias in unit and individual reliability and sharpness data.

### 2. Use of 2WW Form 26 and 2WW Form 28.

a. Form 26. Figure 1 is an example of a completed Form 26. This example is from a series (20) of 4 category forecasts. The form can be used for 2 through 5 categories. There are two distinct sections on the form. The first twenty lines are used for recording forecasts (circled letters) and observations (check marks). The last eight lines are used for summarizing the data.

(1) In the example on the first line a ceiling forecast of 0181 is recorded. This forecast is recorded then by circling the Cat A forecast under Pf = 0%, the Cat B and D under Pf = 10%, and the Cat C under Pf = 80%. The observation is recorded by entering a check mark in the block where the appropriate category has been circled. In the example the 12 Feb 24 hour forecast was zero. Note that both Category C and D were forecast at 40%. In such cases the category which was observed just be annotated along with the checkmark.

(2) The summary section on the example has circled numbers in the left and right margins which are used here for reference. Data is recorded based on what hours are to be verified (3 to 24 in the example), however, the summary is accomplished for all hours combined. The purpose for collecting multiple hour verification is to build a more reliable and representative data base.

Row 1. In each block along this row the sum of Cat A observations (check marks) is tabulated. Zeros are not indicated. In the example there were no Cat A observations.

Row 2, 3, 4, 5. These rows are the summations (as was row 1) of the number of observations for the indicated categories. The purpose of rows 1 through 5 is to facilitate calculation of the category frequencies. This is done by dividing each of the sums on the right (next to rows 3 through 12) by the total number of observations. On the example 4 categories are used; consequently, row 5 is lined out.

Row 6. The sum of the observations (checks) in each column.

Row 7. The sum of the total number of circles (forecasts per Pf in each column).

Row 8. The quotient of 6/Tf or row 6 divided by row 7.

Row 9 and 10. A double check to insure no errors have been made in the tabulation. A horizontal sum across row 6 will always total 20 if the sheet is full. The sum of row 7 indicated in 10 will equal the product of the value in 9 times the number of categories in use. If these two summations do not check out a tabulation error has been made.

As a general rule 20 forecasts are not a large enough sample to gain benefit from the analysis, consequently, two or three forms should be completed before the data is tabulated.

b. Form 28. The primary purpose for this Form is to provide space for graphing and analysis of reliability and sharpness data. Data can be transferred directly from the Form 26 to the Form 28 to facilitate this task. Space is provided for two sets of forecast data. See Figure 2 for example.

(1) To plot reliability the Pf value is plotted on the vertical axis and the ratio (observed frequency) O/Tf is plotted on the horizontal axis. Refer to AWSP 105-51 for background and instructions on the interpretation of reliability data.

(2) Sharpness is a plot of Pf (vertical axis) against Tf, the number of forecasts for each Pf value. Again refer to AWSP 105-51 for interpretation.

Form 28 can be forwarded to 2WW/DN for computation of the Brier Score and associated statistics and analysis of reliability and sharpness. This data can also be called in by phone if only computations are needed. The data should be read in the sequence indicated on Figure 3. The data can be punched into the computer and the statistics read back in a matter of minutes. The computer software and its use is described in Section 4. Both the form 26 and 28 are still test forms and are subject to minor modification, however, this will not change the way the forms are used.

3 To use the HP-97 software for computing the Brier Score, the Brier Score Standard, improvement over standard (IOS) and percent of possible improvement over standard (PPIOS) the following instructions must be followed. The input data is all on 2WW Form 28. The sequential numbers in bold handwriting on Figure 3 are to be punched in the order indicated. In each case below "enter" means punch the number into the X register.

Figure 4 is a copy of the program

Step 1 Load the program

Step 2. Enter N, (1) then punch STO E

Step 3 Enter (2) then punch B followed by R/S.

Step 4 Enter (3) through (20) punching R/S after each number entered.

Note that the X'd out blocks under Pf = .0 and .5 are not entered into the calculator.

Step 5. Enter (21). The calculator will automatically begin to compute and will print the Brier Score. It takes approximately 10 seconds for the program to run.

Step 6. Enter (22) through (26) the calculator will print the standard, the IOS and the PPIOS - in that order. If less than five categories are used zero must be entered for each Cat frequency not represented; e.g. (24), (25) and (26) would all be zero in a two category situations.
